Introduction¶. When we develop a model for probabilistic classification, we aim to map the model's inputs to probabilistic predictions, and we often train our model by incrementally adjusting the model's parameters so that our predictions get closer and closer to ground-truth probabilities.. In this post, we'll focus on models that assume that classes are mutually exclusive.

In order to graph a linear equation you can put in numbers for  $x$  and  $y$  into the equation and plot the points on a graph. One way to do this is to use the "intercept" points. The intercept points are when  $x = 0$  or  $y = 0$ . Plug  $x = 0$  into the equation and solve for  $y$
