Urinary incontinence (UI), also known as involuntary urination, is any uncontrolled leakage of urine. It is a common and distressing problem, which may have a large impact on quality of life. It has been identified as an important issue in geriatric health care. The term enuresis is often used to refer to urinary incontinence primarily in children, such as nocturnal enuresis (bed wetting).

### About Intellectual and Developmental Disabilities (IDDs ...

Uptake, distribution and retention. Approximately 75–90% of ingested fluoride is absorbed and readily distributed throughout the body, with approximately 99% of retained fluoride being bound in calcium-rich tissues such as bone and teeth [6, 15] as well as the calcified parts of the pineal gland [1]. Fluoride also crosses the placenta and reaches the fetus [1, 6] and the amniotic fluid [1].

Neutering (including spaying) of male and female dogs in the first year after birth has become routine in the U.S. and much of Europe, but recent research reveals that for some dog breeds, neutering may be associated with increased risks of debilitating joint disorders and some cancers, complicating pet owners' decisions on neutering. The joint disorders include hip dysplasia, cranial cruciate ...

Developmental Milestones are the skills babies and young children learn as they grow like walking and talking. They are also the bane of many medical students and pediatric residents because there are quite a few different milestones that we are required to memorize and we have to know exactly at what age we should expect each of these to develop.
